### D. Strucyure and configuration, basic measuring circuit

Structure and configuration of MQ-5 gas sensor is shown as Fig. 1 (Configuration A or B), sensor composed by

micro  $Al_2O_3$  ceramic tube, Tin Dioxide ( $SnO_2$ ) sensitive layer, measuring electrode and heater are fixed into a crust made by plastic and stainless steel net. The heater provides necessary work conditions for work of sensitive components. The enveloped MQ-5 have 6 pin ,4 of them are used to fetch signals, and other 2 are used for providing heating current.

Electric parameter measurement circuit is shown as Fig.2

E. Sensitivity characteristic curve

Fig.2 sensitivity characteristics of the MQ-5

Fig.3 is shows the typical sensitivity characteristics of the MQ-5 for several gases.

in their: Temp: 20°C、  
Humidity: 65%、  
 $O_2$  concentration 21%  
 $R_L=20k\ \Omega$

$R_o$ : sensor resistance at 1000ppm of  $H_2$  in the clean air.  
 $R_s$ :sensor resistance at various concentrations of gases.

Fig.4 is shows the typical dependence of the MQ-5 on temperature and humidity.

$R_o$ : sensor resistance at 1000ppm of  $H_2$  in air at 33%RH and 20 degree.

$R_s$ : sensor resistance at different temperatures and humidities.

**SENSITIVITY ADJUSTMENT**

Resistance value of MQ-5 is difference to various kinds and various concentration gases. So, When using this components, sensitivity adjustment is very necessary. we recommend that you calibrate the detector for 1000ppm  $H_2$  or LPG concentration in air and use value of Load resistance ( $R_L$ ) about 20  $K\ \Omega$  (10 $K\ \Omega$  to 47 $K\ \Omega$ ).

When accurately measuring, the proper alarm point for the gas detector should be determined after considering the temperature and humidity influence.
